

Listening to the Network: Leveraging Network Flow Telemetry for Security Applications

Darren Anstee
EMEA Solutions Architect

Introduction

- **Security has an increased focus from ALL businesses, whether they are an enterprise, ISP, IDC or OTT application service provider.**
 - Better awareness of issues & tighter regulation
 - Main-stream press coverage = senior management focus
 - Huge financial / brand costs when something goes wrong

- **So, why is 'Flow relevant to security?'**
 - Flow leverages our investment in the routers / switches within our infrastructure to identify threats to our networks and services
 - Flow is generated regardless of traffic symmetry
 - Flow can be used to detect malware infected hosts, zero-day exploits, attacks, inside misuse / abuse, DDoS etc..
 - Flow can provide a network wide picture of what is actually going on (context)

How can 'Flow Help us?

- **Flow can help us to understand how our networks are used:**
 - We can use flow to build a model of who uses what, when, how often and how much. This can give us a baseline for normal network activity
 - And, we can detect abnormal / malicious / unusual traffic on our networks.
 - We can classify what is going on, in context, to establish our risk.
 - And, we get valuable forensic data.
- **Flow should be one of the key mechanisms we have for monitoring our network, service and data security.**

Agenda

- Introduction
- **What is 'Flow?'**
- How can we use 'Flow for Security Applications
- **Flow Security Use Cases**
 - Network / Data Integrity - Bot Detection
 - Service Availability - DDoS Detection

'Flow, the Voice of the Network

- **Why 'Flow?**
 - Netflow v5/v7/v8/v9, sFlow v4/v5, Jflow, cflow, Netstream v5/v9, IPFix, Flexible Netflow
 - Routers and switches support different versions / types.
 - Cisco, Juniper, Alcatel, Huawei, Foundry, HP, Brocade

- **'Flow maintains traffic data in Flow Records in a flow cache, and optionally exports that flow data to a collection/analysis system.**

- **Flow Records represent a form of network telemetry which can describe the traffic streams headed to / passing through a router**
 - Flow Record = uni-directional traffic flow
 - Bi-directional conversations will be represented by at least two Flow Records (and maybe more).

Flow Records, Key and Non-Key Fields

- Using Netflow v5 Record (still most common).

Key Fields

- Source IP Address
- Destination IP Address
- Source TCP/UDP Port
- Destination TCP/UDP Port
- Input IfIndex
- Protocol
- Type of Service

Non-Key Fields / Counters

- Packet Count
- Byte Count
- First Packet Time
- Last Packet Time
- Output ifIndex
- TCP Flags
- Next Hop Address
- Source AS Number
- Dest. AS Number
- Source Prefix Mask
- Dest. Prefix Mask

Flow Record Export

1. Create and update flows in NetFlow cache

Key fields in yellow
Non-key fields white

SrcIrf	SrcIPadd	DstIrf	DstIPadd	Protocol	TOS	Flgs	Pkts	Src Port	Src Msk	Src AS	Dst Port	Dst Msk	Dst AS	NextHop	Bytes/Pkt	Active	Idle
Fa1/0	173.100.21.2	Fa0/0	10.0.227.12	11	80	10	11000	00A2	/24	5	00A2	/24	15	10.0.23.2	1528	1745	4
Fa1/0	173.100.3.2	Fa0/0	10.0.227.12	6	40	0	2491	15	/26	196	15	/24	15	10.0.23.2	740	41.5	1

2. Expiration

- Inactive timer expired (15 sec is default)
- Active timer expired (30 min (1800 sec) is default)

SrcIrf	SrcIPadd	DstIrf	DstIPadd	Protocol	TOS	Flgs	Pkts	Src Port	Src Msk	Src AS	Dst Port	Dst Msk	Dst AS	NextHop	Bytes/Pkt	Active	Idle
Fa1/0	173.100.21.2	Fa0/0	10.0.227.12	11	80	10	11000	00A2	/24	5	00A2	/24	15	10.0.23.2	1528	1800	4

4. Export version

Non-Aggregated Flows—Export Version 5 or 9

5. Transport protocol

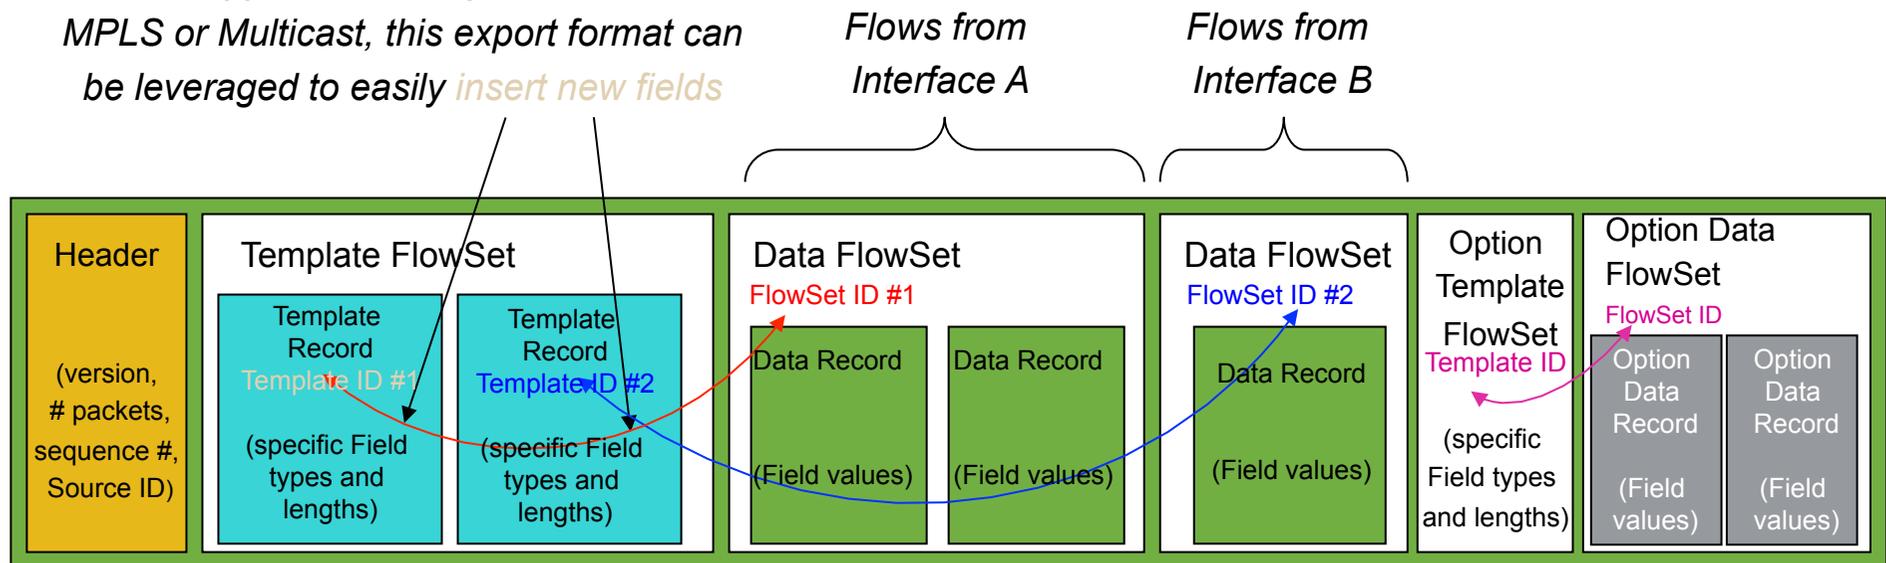

30 Flows per 1500 byte export packet

Extensible Flow : Netflow v9

- **Created to provide flexibility**
 - Additional ‘fields’ can be added to Netflow records.
- **Supported by Cisco, Juniper, Alcatel, Huawei etc...**
- **Required for routers to export Flow Records for MPLS, Multicast and IPv6 traffic.**

To support technologies such as MPLS or Multicast, this export format can be leveraged to easily *insert new fields*

Extensible Flow : Flexible Netflow / IPFix

- **Flexible Netflow (Cisco)**
 - Allows user configurable Netflow Templates
 - Key, non-key, counter, time-stamp fields
 - Customised Netflow cache(s) for specific applications
 - Can reduce overhead:
 - Only 'relevant' information is sampled
 - Only 'specified' fields are stored
 - Introduces many new key / non-key fields
 - Can include NBAR and header / payload extracts.
 - Uses Netflow v9 format for export.
- **IPFix**
 - Standardised - RFC 5101, 5102
 - Similar export format to Netflow v9 but not identical
 - Version 10, sequence number counting etc..
 - Variable length fields etc..

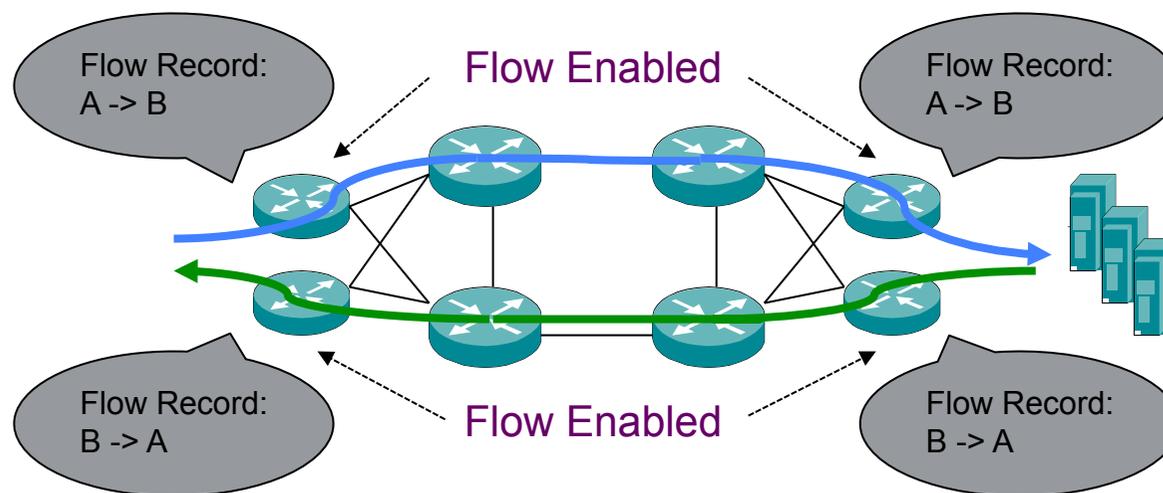

Netflow Considerations

- **Sampled or Un-Sampled 'Flow?**
 - Un-sampled 'Flow is useful for troubleshooting, forensics, traffic analysis, and behavioral/relational anomaly-detection
 - Sampled 'Flow is useful for traffic analysis and behavioral/relational anomaly-detection.
 - The choice comes down to router support / monitored and traffic volume / collection capabilities.

- **Monitoring with 'Flow can scale for very large amounts of traffic**
 - Phone bill v's wire-tap = scalability
 - Who's talking to whom, over what protocols and ports, for how long, at what speed, for what duration, etc.
 - 'Flow allows the routers / switches within the network infrastructure to be used as probes

Netflow Considerations, Where to Listen?

- At network entry and exit points, in front of critical infrastructure to e.g. data-centre, extranet connection, internet gateway, peering edge, wherever we want visibility etc..
- Ingress 'Flow generation should typically be enabled on all router interfaces.
 - Egress 'Flow generation in certain situations.
- If traffic crosses multiple Flow enabled routers, multiple Flow Records may be generated representing the same traffic.

Agenda

- Introduction
- What is 'Flow'?
- **How can we use 'Flow for Security Applications**
- **Flow Security Use Cases**
 - Network / Data Integrity - Bot Detection
 - Service Availability - DDoS Detection

How can 'Flow Help us with our Security Posture?

- As I said earlier....
- **Flow can help us to understand how our networks are used.**
 - We can use flow to build a model of who uses what, when, how often and how much. This can give us a baseline for normal network activity
 - And, we can detect abnormal / malicious / unusual traffic on our networks.
 - We can classify what is going on, in context, to establish our risk.
 - And, we get valuable forensic data.
 - We can discover which customers / services share which infrastructure. This helps us to ensure availability

**Behavioral Detection of Malware
Infected Devices
And DDoS Attacks**

How can we use Flow?

- **We can look at the flow cache on each router. But....**
- **When Flow is enabled on router / switch infrastructure we can use a dedicated analysis systems to collect, detect, report on, and correlate observed activity.**
- **We can:**
 - See collated data across multiple devices.
 - Contrast current / historic traffic levels and patterns.
 - Detect bots / DDoS / insider misuse more easily.
 - Mine historical flow logs for forensic information.
- **Open source and commercial collection / analysis tools are available which greatly enhance the utility of Flow.**

How can we use Flow?

- **Multiple open source tools available:**

- Nfdump / Nfsen
 - <http://nfdump.sourceforge.net/>
 - <http://nfsen.sourceforge.net/>
- Stager
 - <http://software.uninett.no/stager/>
- WebView Netflow Reporter
 - <http://wvnetflow.sourceforge.net/>
- FlowViewer
 - <http://ensight.eos.nasa.gov/FlowViewer/>
- Argus
 - <http://www.qosient.com/argus/downloads.shtml>
- Others :
 - <http://www.switch.ch/network/projects/completed/TF-NGN/floma/software.html>

- **Commercial Tools**

- More flexible, easier to configure, more scalable and supported.

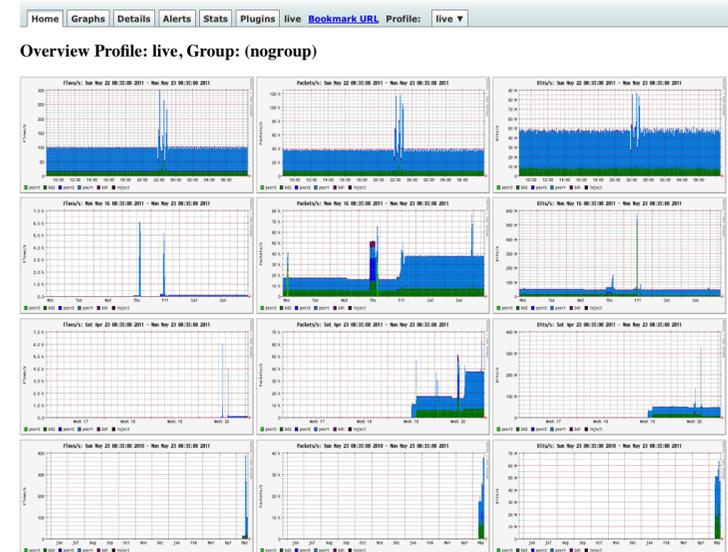

Flow Security Applications

- **Flow can help us to ensure network and data integrity and confidentiality + service availability.**
- **Numerous papers on the use of Flow for security applications:**
 - <http://www.first.org/global/practices/Netflow.pdf>
 - http://www.cert.org/flocon/2011/presentations/Krmicek_Detecting.pdf
 - <http://www.ietf.org/proceedings/78/slides/NMRG-9.pdf>
 - <http://www.math.bme.hu/~slovi/temalabor3.pdf>
 - Using machine learning techniques to identify botnet traffic. Livadas C., Walsh, R., Lapsley, D., Strayer, T. In: Proceedings of the 31st IEEE Conference on Local Computer Networks, 2006
 - Traffic aggregation for malware detection. Yen, T.-F., Reiter, M. K. . In: Proceedings of the 5th international conference on Detection of Intrusions and Malware, and Vulnerability Assessment (DIMVA '08), 2008
 - These are just a sample
- **Going to look at some (simple) examples**
 - Much more complex mechanisms available, see papers above

How can we use Flow?

- **Using :**
 - Nfdump / Nfsen, as an example
- **Why Nfdump / Nfsen?**
 - Flexible data-collection
 - Netflow v5 / v9, Sflow
 - Collated view of flow data
 - Good performance and scalability
 - Flexible, ad-hoc filtering of data
 - Good for investigating what is going on
 - Relatively easy to install / configure
 - Can be 'working' in less than a day
- **Why not send flow straight to a database?**
 - Scale, performance, scale, performance.....
- **Why not send flow to an event correlation system (splunk)?**
 - Flow is not refined enough
 - Use splunk for correlation of infection indicators from flow.

Agenda

- Introduction
- What is 'Flow'?
- How can we use 'Flow for Security Applications
- **Flow Security Use Cases**
 - Network / Data Integrity – Indications of Malware Infection
 - Service Availability - DDoS Detection

Using Flow for Bot Identification

- Malware
 - Short for *malicious software*. Programming (code, scripts, active content, and other software) designed to disrupt or deny operation, gather information that leads to loss of privacy or exploitation, gain unauthorized access to system resources, and other abusive behavior. Source : US-CERT
- Botnet
 - In malware, a botnet is a collection of infected computers or bots that have been taken over by hackers (also known as bot herders) and are used to perform malicious tasks or functions Source : Wikipedia
- Flow can help us ensure data and network integrity by providing cross-network visibility of malware infected devices:
 - **Based on behavioral analysis / anomalies – zero day**
 - **Based on a match to ‘known’ behavior - CnC server**

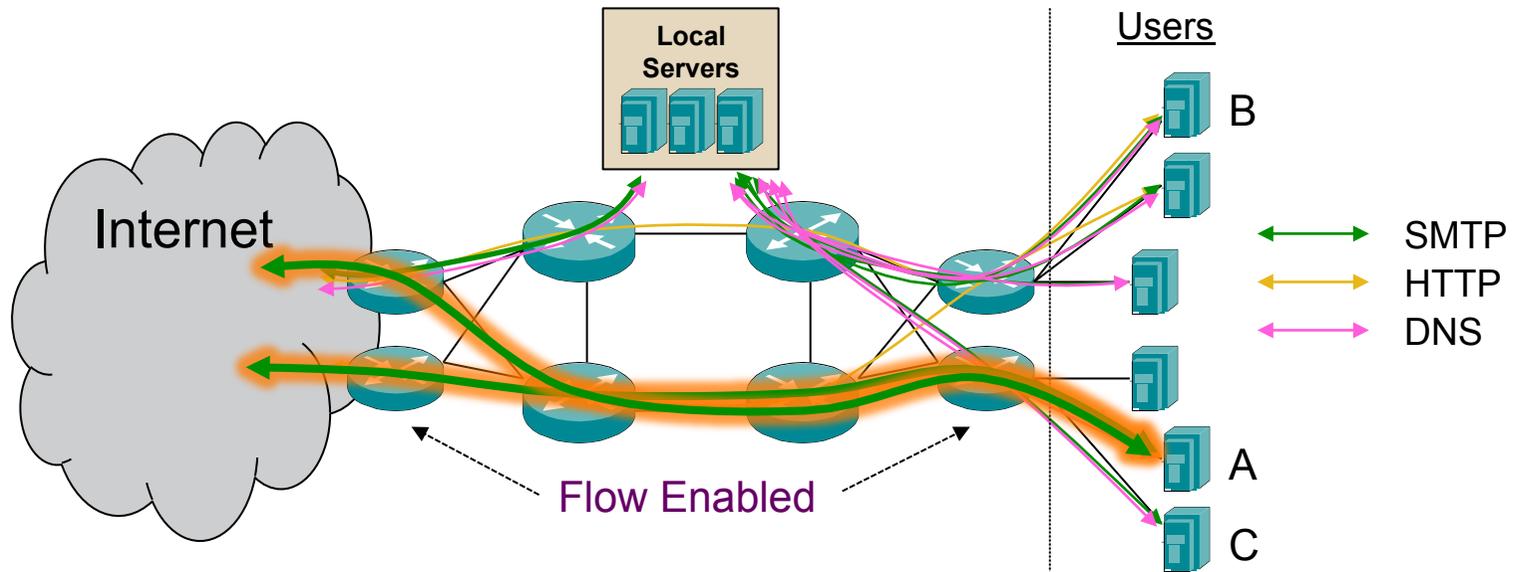

Using Flow for Bot Identification

- **Detection via (simple) behavioral analysis / anomalies**
 - Allows us to detect zero day infections (no signature)
 - Utilises a match, or matches, on unusual host behavior:
 - Unusual outbound SMTP (Spam generation)
 - Off-net DNS queries
 - Scan detection
 - Based on outbound (DDoS) behavior
 - Other indicators – long-lived flows, unusual high volume transfers to external hosts etc..
 - Match more than one behavior, the likelihood of compromise grows

Using Flow for Bot Identification

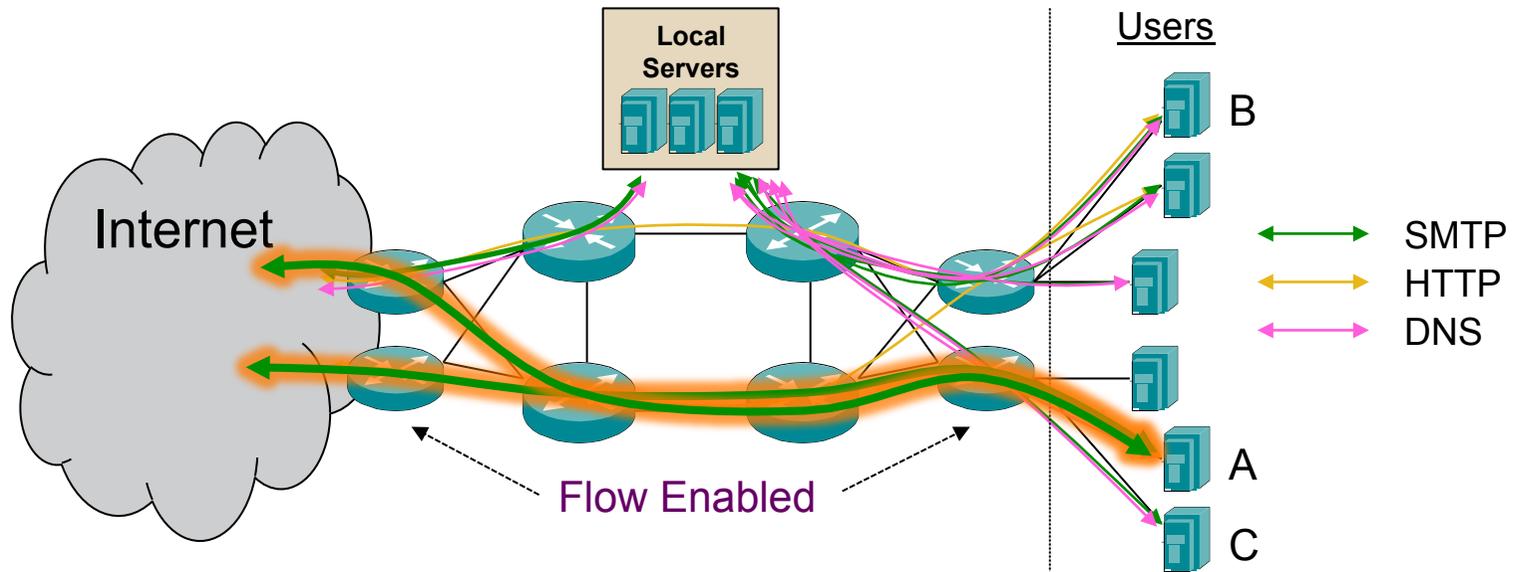

- **Using a test network for examples, with real malware samples.**
 - Users on the 10.2.24.0/24 subnet
- **NOTE: Even if firewalls block traffic, routers / switches will still generate flow.**
- **NOTE: Even if routers / switches block traffic, they will still generate flow.**

Using Flow for Bot Identification : Outbound SMTP

Host	Outbound SMTP	Off-Net DNS	Scanning	Outbound DDoS	Long Lived	High Volume	Possible Compromise

Using Flow for Bot Identification : Outbound SMTP

- **Bots can be used for Spam generation.**
 - Users do not normally use multiple external SMTP servers / send very large volumes of email. We can look for this behavior.
- **We can use nfdump to generate a list of sources, ranked by number of packets (we could use flows, bytes etc..)**
 - Traffic destined to port 25
 - Not going to local servers (172.16.0.0/16 in this case)
 - Constrain source based on desktop / customer address space (10.2.24.0/24 in this case)

```
nfdump -R . -t 2011/05/02.00:00:00-2011/05/09 -s srcip/packets 'src net 10.2.24.0/24 and dst port 25 and not dst net 172.16.0.0/16'
```

Top 10 Src IP Addr ordered by packets:

Using Flow for Bot Identification : Outbound SMTP

- **Host attempted to use four different SMTP servers**
 - Succeeded in utilizing one of them – unusual behavior
- **Also we can resolve the IP addresses of the servers to see if they look unusual, in this case:**
 - mxs.mail.ru
 - mx4.messagingengine.com
 - mail7.hsphere.cc
- **This may not be normal (dependent on your users), but now we know what question to ask.**
- **However, this is just one indicator.**
 - We can correlate the results of multiple indicators
 - Develop a higher confidence that a host is compromised.
- **NOTE: Script and cron for periodic, automated reports.**

Using Flow for Bot Identification : Non-Local DNS

Host	Outbound SMTP	Off-Net DNS	Scanning	Outbound DDoS	Long Lived	High Volume	Possible Compromise
A	✓						?
B							?

Using Flow for Bot Identification : Non-Local DNS

Host	Outbound SMTP	Off-Net DNS	Scanning	Outbound DDoS	Long Lived	High Volume	Possible Compromise
A	✓	✓					✓
B							?

Using Flow for Bot Identification : Non-Local DNS

- **Most network hosts will utilise the local DNS servers**
 - There will be legitimate exceptions
- **As with SMTP we can query our flow data:**
 - My local DNS server is 10.2.0.25
 - Constraining the src addresses to be within my 'user' space.

```
nfdump -R . -t 2011/05/02.00:00:00-2011/05/09.00:00:00 -s srcip/packets 'src net 10.2.24.0/24 and  
dst port 53 and not dst host 10.2.0.25'
```

Top 10 Src IP Addr ordered by packets:

Date first seen	Duration	Proto	Src IP Addr	Flows(%)	Packets(%)	Bytes(%)
pps bps bpp						
2011-05-03 00:05:49.508	32.419	any	10.2.24.30	5(100.0)	9(100.0)	555(100.0)
0	136	61				

Summary: total flows: 5, total bytes: 555, total packets: 9, avg bps: 136, avg pps: 0, avg bpp: 61
Time window: 2011-05-03 00:05:49 - 2011-05-03 00:06:21

71 1							

Summary: total flows: 5, total bytes: 555, total packets: 9, avg bps: 136, avg pps: 0, avg bpp: 61

Time window: 2011-05-03 00:05:49 - 2011-05-03 00:06:21

Total flows processed: 3603568, Blocks skipped: 0, Bytes read: 270685632

Sys: 0.509s flows/second: 7066304.6 Wall: 0.503s flows/second: 7158714.5

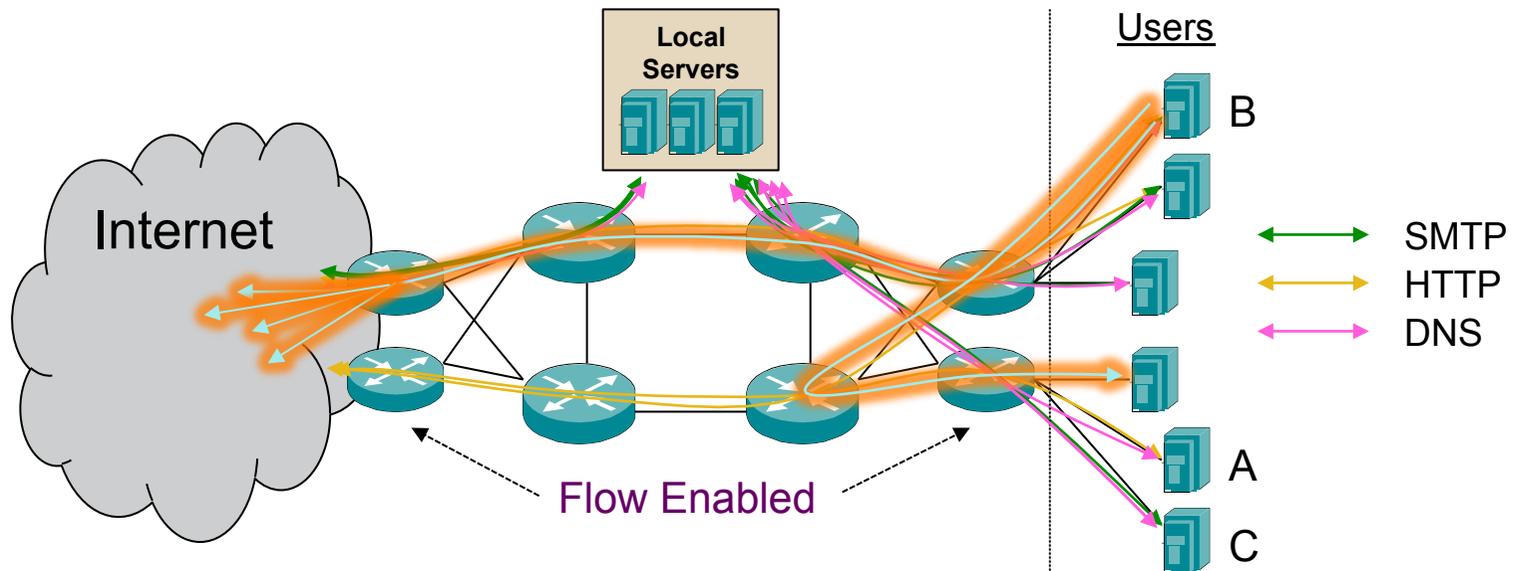

Using Flow for Bot Identification : Non-Local DNS

- If we resolve the DNS servers we can see that they were a,d and m root server instances.
 - Unusual for a user host.
- And, this is the same user IP as before :
 - Multiple indicators for the same IP
 - So, probably worth investigating this machine further.
 - Or, we can look for other indicators....

Host	Outbound SMTP	Off-Net DNS	Scanning	Outbound DDoS	Long Lived	High Volume	Possible Compromise
A	✓	✓					✓
B							?
C							?

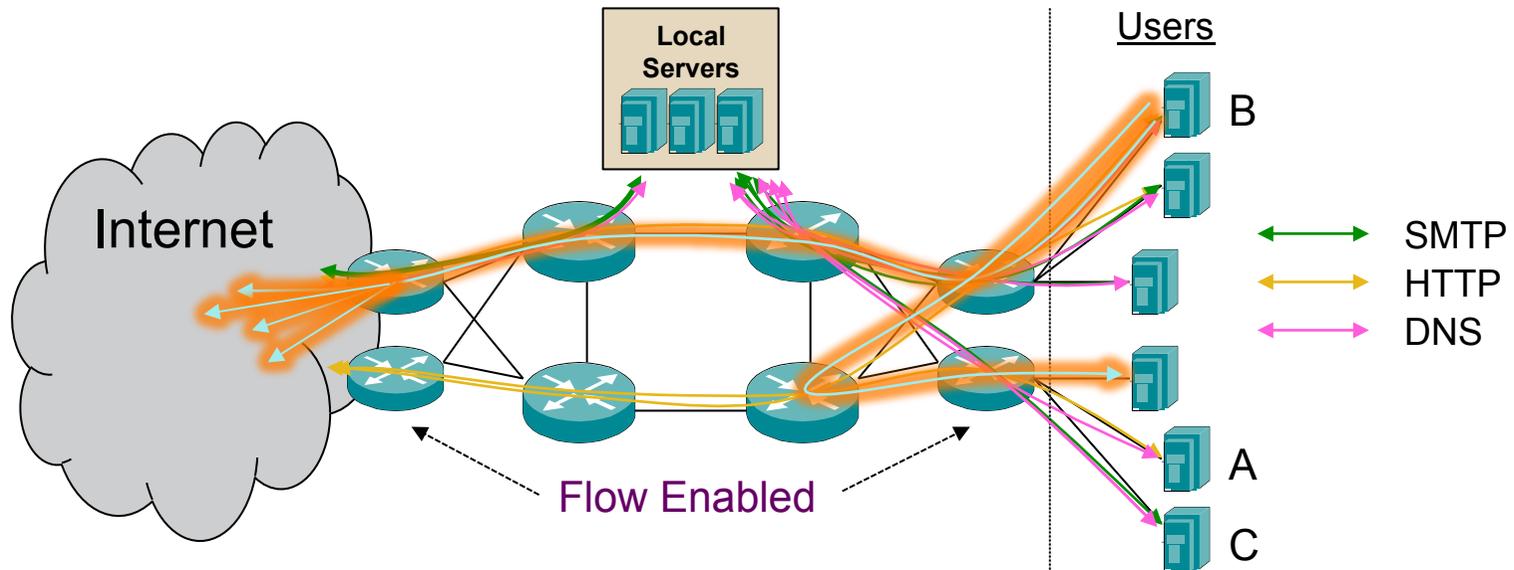

- **NOTE:** Can use a database (MySQL, for example) or splunk to correlate the results of indicators.

Using Flow for Bot Identification : Scanning

B			✓	✓			✓

Using Flow for Bot Identification : Outbound DDoS

- **Outbound DDoS traffic is another (strong) indicator**
 - Even if the traffic doesn't make it out of the network Flow will still be generated.
- **Look for common attacks types:**
 - SYN Flood, RST Flood, UDP Flood, ICMP Flood etc..
- **Implement detection 'thresholds' by using a combination of 'pps' and 'packets' filters when searching for flows.**

```
nfdump -R . -t 2011/05/02.00:00:00-2011/05/09.00:00:00 'src net 144.0.0.0/8 and proto icmp and pps > 100 and packets > 3000 and duration > 30000'
```

```
.....snip  
2011-05-03 18:35:55.973 59.967 ICMP 10.2.24.32:0 -> XXX.255.182.167:8.0 6716 402978 1  
.....snip
```

- **ICMP Flows with pps rate > 100 and with more than 3K packets counted and duration of more than 30 seconds.**
 - NOTE: nfdump cannot filter on a duration longer than your active flow expiry timer.

Using Flow for Bot Identification : Outbound DDoS

- If we detect a host generating any unusual, malware related, behavior use the flow log as a forensic tool to try establish potential CnC server addresses

```
nfdump -R . -t 2011/05/03.18:30:00-2011/05/03.18:40:00 'src host 10.2.24.32'
```

```
.....snip
```

```
2011-05-03 18:35:43.389 0.000 UDP 10.2.24.32:138 -> 172.24.50.103:138 10 2080 1
2011-05-03 18:35:54.461 0.469 UDP 10.2.24.32:1025 -> 172.24.50.1:53 1 61 1
2011-05-03 18:35:54.952 56.409 TCP 10.2.24.32:1048 -> XXX.186.38.173:5050 5 441 1
2011-05-03 18:35:43.389 0.000 UDP 10.2.24.32:138 -> 172.24.50.103:138 10 2080 1
2011-05-03 18:35:55.973 59.967 ICMP 10.2.24.32:0 -> XXX.255.182.167:8.0 6716 402978 1
```

```
.....snip
```

- Outbound connection just before the attack flow.
 - This might be perfectly valid
 - 5050 is one of the yahoo messenger ports
 - the destination IP resolves to a .cn domain
- But, Flow has given us the ability to investigate.
 - Now we can ask **the right questions** etc..
- We can then search our flowlog to see if any other hosts connect to our potential CnC address – as they will also need investigation / clean-up

Using Flow for Bot Identification : Other Indicators

- Other potential indicators of security issues using flow
 - Large volumes of traffic leaving our network unexpectedly
 - Indicative of file transfers / streaming / p2p etc..

```
nfdump -R . -a -L +20M -t 2011/05/16.00:00:00-2011.05/23.00:00:00 'src net 10.2.24.0/24'

```

Using Flow for Bot Identification : Known CnC

- **As well as behavioral anomalies, we can also look for traffic towards 'known' CnC servers.**
 - Need a list of known CnC IPs.
 - These lists can be LARGE.
 - Lists can be obtained from a variety of sources e.g.
 - <http://www.emergingthreats.net/index.php/rules-mainmenu-38.html>
 - <http://www.sunbeltsoftware.com/Malware-Research-Analysis-Tools/ThreatTrack/>
 - **Search our flow logs to establish if any connections match our list of CnC IPs**
 - Using an Arbor list here

proto tcp AND ((port 5276 AND (host 210.166.220.222)) OR (port 6660 AND (host 84.208.29.17 OR host 69.61.21.115 OR host 67.198.195.194 OR host 194.14.236.50 OR host 217.174.199.222 OR host 195.13.58.57 OR host 64.32.20.108)) OR (port 6661 AND (host 202.156.1.18)) OR (port 6662 AND (host 84.27.119.230)).....VERY LONG

- **We can clearly see a host within our user / customer address range.**

Using Flow for Bot Identification

- **Flow is a cost-effective and scalable way of detecting malware infected hosts.**
 - Leverages the functionality available within routers / switches
 - We can see ‘inside’ the network
- **Not reliant on signatures (zero-day)**
- **Provides multiple ‘indicators’ that a host may be infected**
 - The more indicators, the more likely the host is compromised
- **Detailed forensic data to establish exposure.**
- **Why use flow over firewall logs?**
 - Pervasive visibility, context, scalability, standardized record formats, easy to use open-source tools.
- **Flow can help us ensure the integrity of our networks / data.**

Using Flow for Bot Identification

The screenshot displays the ARBOR Peakflow-X web interface, which is used for network traffic analysis and bot identification. The interface is divided into several sections:

- Activity Section:** Lists various security events with columns for Severity, Behavior, Creator, Traffic Over 24h, and Approved Traffic (Avg / Max). Key events include:
 - Phishing Hosting Server Traffic Identification (Severity 10)
 - Dark IP Traffic (Severity 9)
 - Novell eDirectory Server Monitor Remote Exploit Activity (Severity 9)
 - Symantec VERITAS Backup Exec Remote Agent for Windows Servers CONNECT_CLIENT_AUTH Buffer Overflow Vulnerability (Severity 9)
 - Windows Internet Naming Service (WINS) Scanning (Severity 9)
 - Direct Connect (Severity 8)
 - Microsoft Windows Server Service NetApi32 CanonicalizePathName() Stack Overflow Vulnerability (Severity 8)
 - W32.Nirbot.Variants (Severity 7)
 - Cisco IOS Crafted IP Option Vulnerability (Severity 7)
 - Microsoft Well Known Service Scans (Severity 1)
 - Remote Access App (Severity 1)
 - YouTube Video Site (Severity 1)
 - Facebook Social N (Severity 1)
 - Meqaupload Traffic (Severity 1)
 - DNS Hijacking (Severity 1)
 - Trojan Zeus (Severity 1)
 - Botnet Command (Severity 1)
- Event Details Section:** Provides a summary for the selected event, "BOTNET COMMAND AND CONTROL SERVER TRAFFIC IDENTIFICATION". It includes details such as ID, Update, Revision, and Severity, along with a description of botnets and a "Details" link.
- Traffic Analysis Section:** Features a line graph showing traffic volume over time (May 2011) and a table of "TOP 10 SERVERS" and "TOP 10 CLIENTS".

Key Server	Bytes	kps	Percent	Groups
198.108.81.1 (ashwin1.phobos.org)	302.45 G	29.08 Mbps	23%	...
204.39.8.8 (0)	225.91 G	28.01 Mbps	18%	...
198.108.81.2 (0)	138.84 G	12.84 Mbps	10%	...
204.39.21.8 (0)	36.89 G	3.43 Mbps	3%	...
204.39.21.2 (0)	18.01 G	1.67 Mbps	1%	...
198.108.81.3 (0)	17.33 G	1.60 Mbps	1%	...
88.202.31.138 (0)	17.31 G	1.60 Mbps	1%	...
204.39.26.41 (0)	16.77 G	1.55 Mbps	1%	...
198.108.81.208 (0)	15.17 G	1.41 Mbps	1%	...
204.39.12.82 (ashwin1.cust.net)	14.62 G	1.30 Mbps	1%	...
Other (198.11.1 servers)	504.55 G	55.05 Mbps	42%	...
- Alerts Section:** Displays a list of alerts with columns for Severity, Client Interface, Num Servers, Num Services, Application, Bytes, First, and Last. The alerts are categorized by severity (e.g., 10, 9) and include links to view details.

Agenda

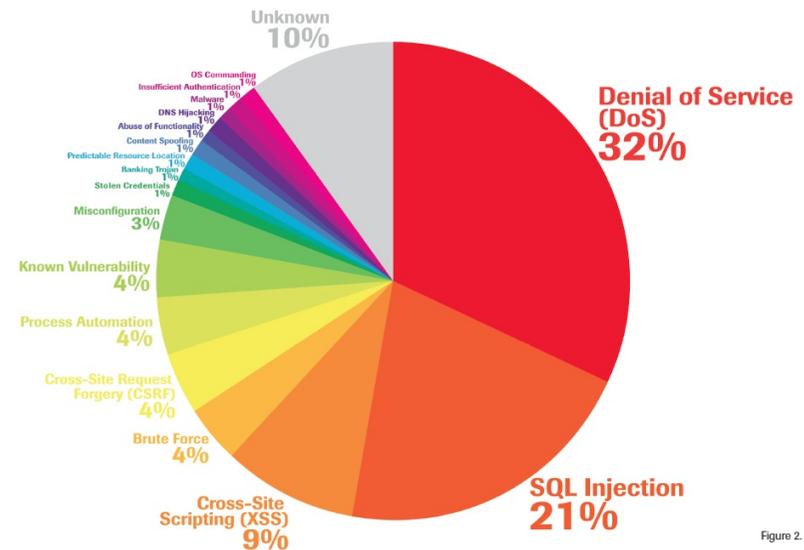

- Introduction
- What is 'Flow'?
- How can we use 'Flow for Security Applications
- **Flow Security Use Cases**
 - Bot Detection
 - DDoS Detection

Using Flow for DDoS Detection : Primer

- Flow can also help us to detect and classify DDoS attacks, a major threat to service availability.

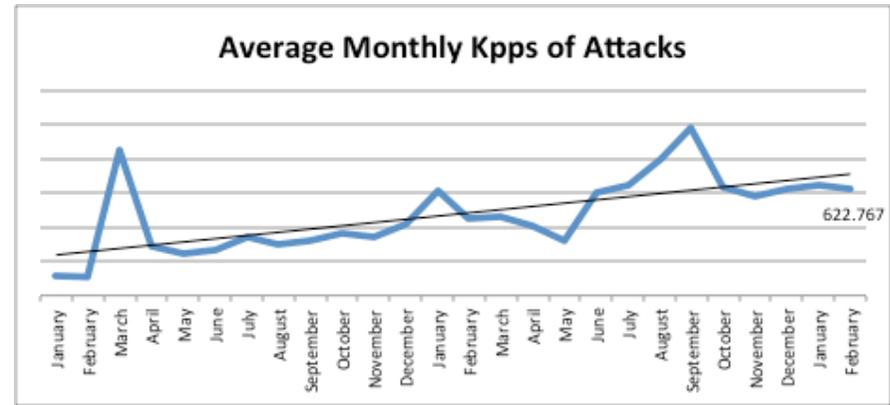

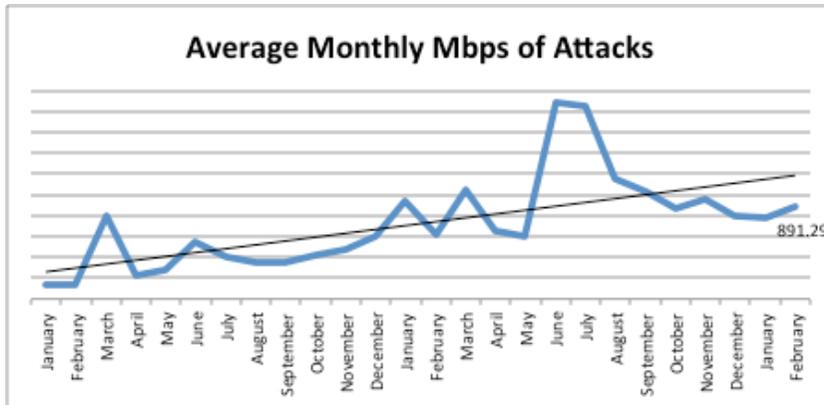

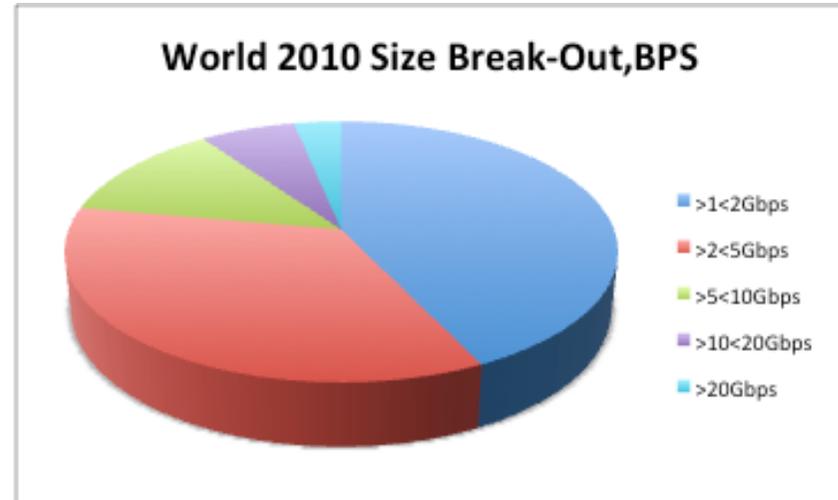

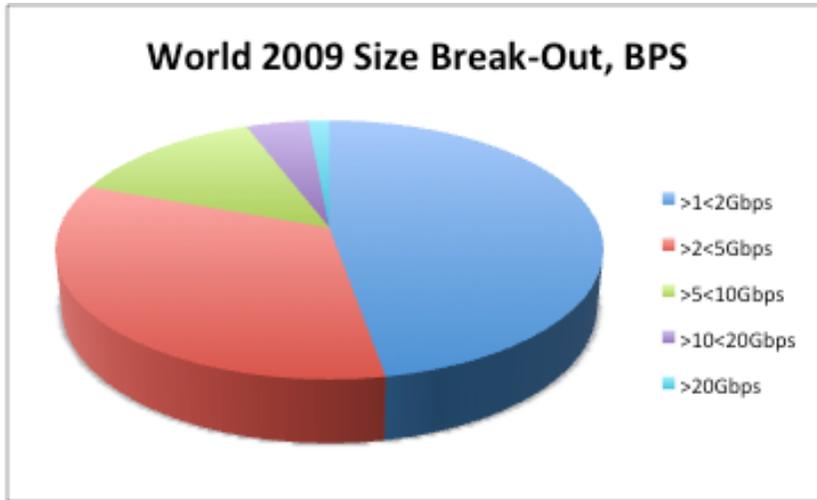

What is a Denial of Service attack?

- An attempt to consume finite resources, exploit weaknesses in software design or implementation, or exploit lack of infrastructure capacity
- Effects the availability and utility of computing and network resources
- Attacks can be *distributed* for even more significant effect
- The *collateral damage* caused by an attack can be as bad, if not worse, than the attack itself

Source: Top Attack Methods, Trustwave WHID Report

DDoS Data for 2010 – Arbor ATLAS Initiative

Flow Based Detection Techniques

- **Baseline Detection**
 - Detecting shifts in traffic above what is normally seen
 - Catches non standard application/protocol floods, multi-victim attacks, application attacks, changes in GeoIP traffic mix.

- **Misuse (Flood) Detection**
 - Detecting host traffic that exceeds normally accepted Internet behavior
 - Catches common attack vectors like SYN floods, ICMP floods, DNS floods

- **Fingerprint Detection**
 - Detecting known anomalous traffic behaviors indicative of a known threat. Malware detection, specific packet size attacks

Using Flow for DDoS Detection

- We can ‘classify’ and ‘trace-back’ DDoS attacks (and other network events) using the Flow cache on our routers / switches.
 - Difficult to do pro-active detection.
 - But, no need to export the flow, deploy collectors etc..

```

- TCP Flags field is logical OR of flags seen on all packets matching a flow.
- Just SYN indicates a problem.
- SYN Flood attack in this case.

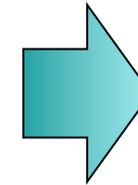

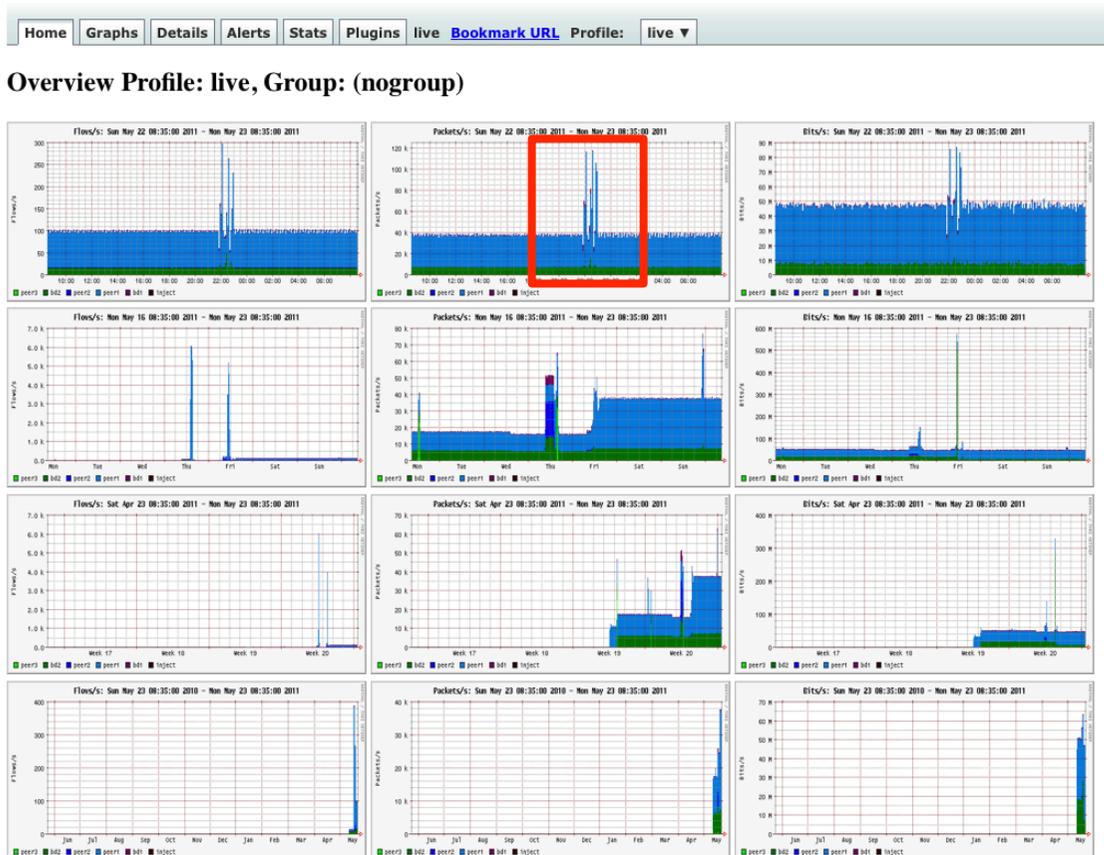

Using Flow for DDoS Detection

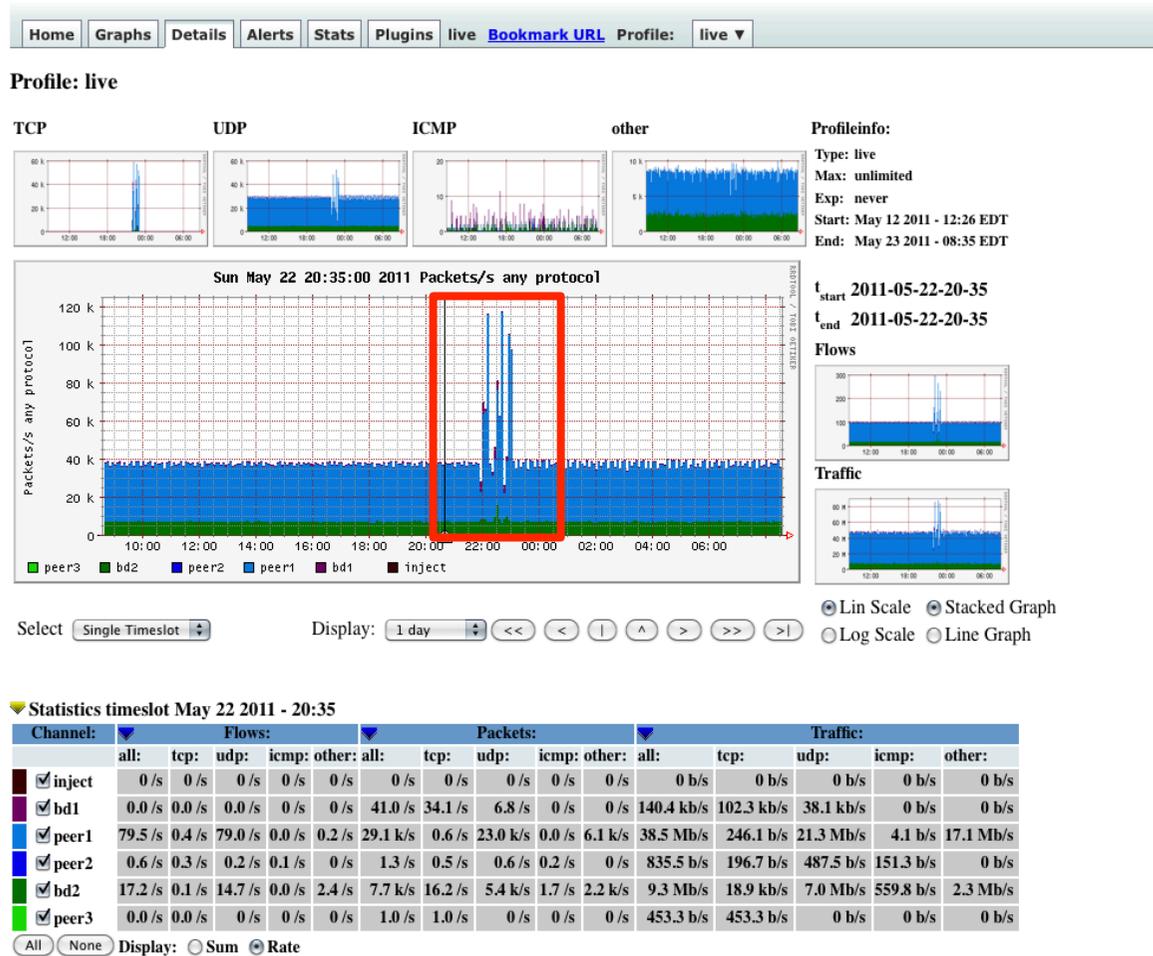

- **As with Bot detection we can use open-source tools for DDoS detection**
- **Nfsen can provide a graphical view of traffic.**
 - Many other tools available
 - Establish which routers / infrastructure carry traffic for which customer / service
 - Understand when / where there will be collateral damage.

Using Flow for DDoS Detection

- Can use graphs to identify changes in traffic pattern.

Using Flow for DDoS Detection

Using Flow for DDoS Detection

- Can use nfdump, as before, to classify our traffic.
- Flow can provide both Detection and Classification information.
 - Classification / Trace-Back data needed for mitigation

Using Flow for DDoS Detection

- Can also use Alerts of pro-active detection of specific traffic
 - SYN floods, UDP floods etc..
- Can also use plugins (freely available) which extend this functionality

Alerts details: Server_Group_1_DNS

Trigger	Status	Last Triggered
armed	<input checked="" type="checkbox"/> enabled	never

Filter applied to 'live' profile:

bd1
peer1
peer2
bd2

dst net 8.1.1.0/24 and dst port 53

Conditions based on total flow summary:

Conditions based on individual Top 1 statistics:

6 Packages/s of Top 1 DST IP Address > 500

Conditions based on plugin:

Trigger:

Each time after 1 x condition = true, and block next trigger for 0 cycles

Action:

No action

Send alert email To: danstee@arbor.net

Subject: Alert triggered for Server Group 1 DNS Traffic Level

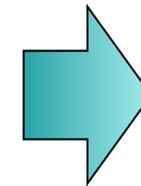

Call plugin: No alert plugins available

Cancel Commit Changes

Using Flow for DDoS Detection

- We can create Profile(s) (retrospectively) to more easily visualize traffic changes.
 - Can include filters in Profile to zoom in
 - Can help us to trace traffic across the network, visualise which routers are reporting the change.

Using Flow for DDoS Detection

Using Flow for DDoS Detection

- **DDoS poses a growing service availability risk**
- **Cost-effective and scalable way of detecting and classifying DDoS attacks.**
 - Leverages the functionality available within the routers / switches
 - Can monitor very large traffic volumes, across multiple routers, over an unlimited geographic area.
 - Collection can be centralized or distributed, dependent on scale / processing requirements.
 - Provides pro-active detection, classification and trace-back of events.
- **Not reliant on signatures (zero-day)**
- **Does not introduce additional state into the network**
 - which increases the attack surface.
- **Helps us ensure the availability of our services.**

Thank You

Darren Anstee
